

Fujicolor Processing needed a 'snapshot' of their compliance status.

The Challenge

With a loosely structured environmental management information system (EMIS) in place, Fujicolor Processing was concerned about being out of compliance without knowing. They needed a solution to centralize data and assure compliance at locations across the United States.

The Solution

As the leading software as a service (SaaS) provider, Enviance is able to manage data securely and keep it easily accessible online, while providing efficient and uniform processes to improve performance.

The Benefits

- Compliance assurance
- Accountability
- Centralized data for all users
- Efficient and consistent processes

“With Enviance, I am informed right away if any wastewater discharges exceed our company standards. At one of our facilities, we have a very challenging ammonia limit to meet. Since the facility inputs its test data as soon as it is received, I get an email notice right away if the test results are out of the acceptable range. This gives me the opportunity to address the issue much more quickly than if I had to wait for the written report to arrive in the mail.”

Celia Bayless, VP, Environment, Health and Safety

Fujicolor Processing operates photofinishing facilities across the United States, and each facility processes film and makes photographic prints. Since film processing is a water-based procedure, Fujicolor Processing needs to assure compliance for all of their wastewater discharge permits and other obligations.

In 2004, the organization decided it was time for an overhaul of its EMIS. Fujicolor Processing was concerned about comprehensively tracking and overseeing compliance data for their wastewater permits. After the organization's business processes were analyzed, the Enviance System was recommended as a solution for its needs. While there was initial resistance from those wanting to build an internal system, it was ultimately decided that the Enviance solution would save money and time in the end.

The Enviance System provides all the tools Fujicolor Processing needs.

Fujicolor Processing uses the System's tasking function to assure that all necessary steps are being taken to remain in compliance. Reminders are located in an easy to use calendar that progressively escalates status as more time passes, and internal notifications of non-compliance are issued to resolve problems quickly and efficiently.

The System provides the tools necessary to ensure on time:

- report preparation
- inspection completion
- equipment maintenance
- training completion

With the Enviance System's built-in functionality, reports are generated and used to track test results and metrics – which can be used for OSHA and other agency reporting.

Fujicolor Processing frequently uses reporting to track energy and water usage – contributing to the improvement of their energy management program. Internal audits to reduce consumption are now easy to compile since monthly costs and consumption levels are all tracked in one central location – the Enviance System.

The System is used on a daily basis to assure compliance.

Fujicolor Processing's Environmental, Health and Safety (EH&S) Policy states: "EH&S protection and compliance are important components of Fujicolor Processing, Inc.'s business strategy, essential to our continued success and to the personal wellbeing of our employees and the communities in which we operate." The Enviance System helps ensure this policy is carried out by allowing Fujicolor Processing to see a 'snapshot' of their compliance status for any time, location, or permit.

According to Celia Bayless, VP, Environment, Health and Safety, "We needed a mechanism for communication, to assure that everyone has access to the same information at the same time. We also needed a way to ensure that all environmental personnel are doing what they are supposed to be doing. We finally have that with Enviance."

The Enviance System is available anywhere there is an Internet connection – so uniform data is available to users at multiple locations, any time of day. Now Fujicolor Processing has an EMS that can manage tasking, reporting, and permit tracking with efficient and effective processes.

Fujicolor Processing improves performance.

The Enviance System has made it easy to assure compliance anytime, anywhere. Because of the System's efficiency and functionality, Fujicolor Processing has been able to adopt a proactive approach to compliance. The organization consistently assures and works to improve compliance, rather than just reacting to non-compliance.
